

RD^X® QuadPAK™

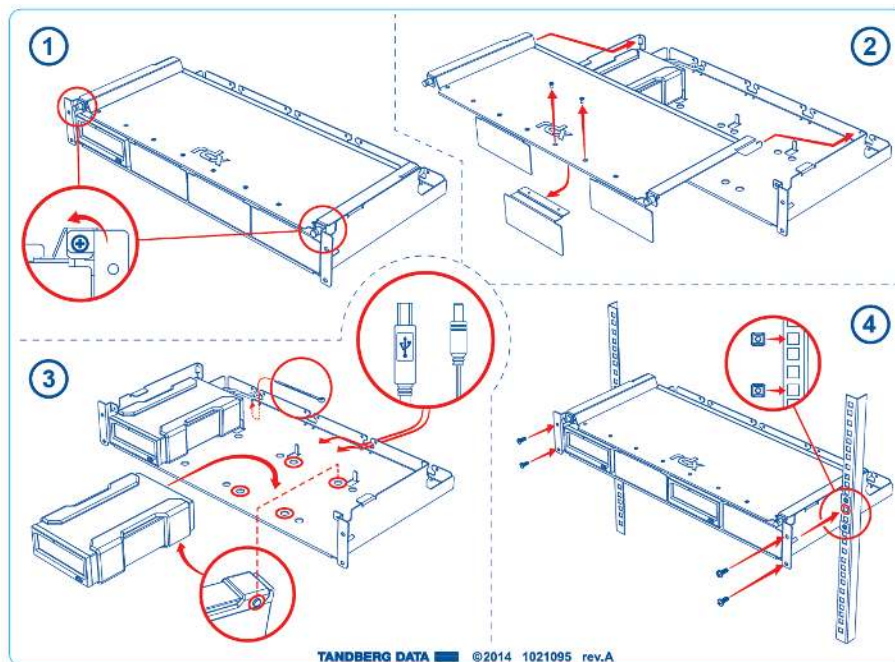

Installation Guide V 1.0

Easy Installation and Easy Handling

The RDX QuadPAK rack mount solution is 1.5U high and allows up to four RDX external drives to be securely installed in a 19" rack. The RDX QuadPAK is easy to install and use.

QuadPAK is accessible from the front without the need for pulling it outside the rack. RDX QuikStor drives can be easily added or removed without a screwdriver. After loosening two thumbscrews screws, the top cover can be removed from the kit and additional external RDX USB 3.0 drives can be easily placed into the QuadPAK shelf by positioning the rubber feet of the drive into dedicated holes of the shelf. Empty slots are covered with provided bezels. As RDX QuadPAK does not contain an internal power supply, power to the RDX external drives is provided via the existing RDX external power supplies. The RDX QuadPAK includes zipties to prevent the USB interface or power cable from being accidentally disconnected.

Simply add another RDX Drive

1. Loosen the two thumbscrews at the front.
2. Slide the cover towards the front and remove bezel.
3. Place the additional RDX drive to its position and make sure, that the rubber feet sit in the dedicated holes.
Lay the USB and power cable through the nozzle at the rear side and fix them with a zip tie. Close the cover by sliding it to the back of the rack mount kit and fasten the thumbscrews.
4. Install the rack mount kit into the rack.
